

Creating some random names

```
first_name <- as.vector(randomStrings(n = 10, len = 5, digits = F))
last_name <- as.vector(randomStrings(n = 10, len = 7, digits = F))
```

concatenating first and last names

```
names=paste(first_name, last_name)
```

Converting to a df

```
names <- as.data.frame(names)
```

The letter case is currently out of order which can be remedied using the `str` function that comes with the `stringi` package.

The following options are available:

To proper

```
names <- stri_trans_totitle(names) names
```

To lower

```
names <- stri_trans_tolower(names) names
```

To upper

```
names <- stri_trans_toupper(names) names
```
